## **Introduction to Computer Programming in Engineering and Science**

<b>Objectives:</b>	00UV	Discipline:	Computer Science,
			Physics, Mathematics, Biology, Chemistry
<b>Ponderation:</b>	3-2-3	Course Code:	360-420-DW
Prerequisite:	00UM, 00UP, 00UT	Course Credit:	2 2/3
Corequisite:	00UQ	Semester:	4

## Introduction

*Introduction to Computer Programming in Engineering and Science* is offered to students in their final semester. The course focuses on the use of computational methods to solve complex problems in science and

## STANDARD

## LEARNING OBJECTIVES

- 4. Correct graphical and mathematical representations of systems
  5. Appropriate use of

OBJECTIVE	STANDARD	LEARNING OBJECTIVES

	OBJECTIVE	STANDARD	LEARN	ING OBJECTIVES
			4.9.8.	Identify the order of precedence of relational and logical operators.
			4.9.9.	Understand short circuit evaluation.
			4.9.10.	Understand data validation and its importance to data integrity and system.
		4.10. Design a method that	4.10.1.	Solve problems by constructing and using methods that perform one major task.
		solves a single	4.10.2.	Create a method.
		identifiable task	4.10.3.	Invoke a method.
			4.10.4.	Pass primitive data values to a method.
			4.10.5.	Return a single value from a method.
			4.10.6.	Pass a reference value to a method.
5.	To apply	5.1. To solve mathematical	5.1.1	Use arithmetic operators respecting the rules of precedence.
	numerical methods	problems numerically	5.1.1.	Convert arithmetic expressions into Java expressions.
	and computer	using Java	5.1.2.	Evaluate Java arithmetic expressions.
	programming		5.1.3.	Recognize the limitations of numeric data types.
	techniques to solve		5.1.4.	Explain overflow and underflow errors.
	scientific and		5.1.5.	Cast from one primitive data type to another.
	engineering		5.1.6.	Explore and use classes from Java's standard packages.
	problems		5.1.7.	Use methods of the Math class – pow(), sqrt(), round(), random(), min(), and max().
		5.2. Learn appropriate	5.2.1.	Define appropriate convergence conditions for iterative methods.
		numerical methods to	5.2.2.	Understand and minimize errors related to numerical solution of mathematical equations.
		computation of a model	5.2.3.	Solve scientific models involving non-linear equations by a variety of methods.
			5.2.4.	Solve scientific models involving first-order ordinary differential equations (i.e. initial and boundary value problems) using Euler or related methods.
			5.2.5.	Solve other type of scientific models using the appropriate numerical techniques (e.g. by
			5.2.6.	Fourier or Laplace transform, Monte-Carlo, Newton-Raphson, etc.) Perform simple numerical optimization given a well-posed problem (e.g. by golden
				section search method, downhill simplex method, genetic algorithm, etc.)
6.	To apply a general approach to model			
	development, application and			

6.2. Appropriate use of	6.2.1.	Translate model into a form suitable for a computational solution
computational methods	6.2.2.	Identify numerical method(s) best suited to solve a given model
	6.2.3.	Identify which optimization algorithm is best suited to solve a model
	6.2.4.	Determine appropriate numerical parameters for solution of the model (e.g. sample size,
		time step, etc.)
	6.2.5.	Evaluate a solution for convergence
6.3. Evaluation of computational methods	6.3.1.	Test the validity of the computational method on simpler problems that are well understood.
1	6.3.2.
